Step 1: Open AutoCAD and create a new drawing. Step 2: Choose Home tab | Drawing panel | Rectangle tool (Fig. 1). Step 3: Set the height to 5cm (2in), width to 5cm (2in), and click on the right button to set the color to red (Fig. 2). Step 4: Select the bottom line and you'll see a small rectangle form (Fig. 3). Step 5: Press Enter (or click on the left button), and the new shape will be created (Fig. 4). If you want to draw a triangle, a polyline or another type of rectangle, then follow the same steps. I'm still working on the Lindbergh baby case. I plan to post about it here when I get back to it, but I'm trying to move on. I like to start off each of my posts on a new case with a couple of introductory threads, and I thought it would be a good idea to do that with the Lindbergh baby case, but I have decided to just make it one big discussion. The other day I wanted to find a copy of "The Kidnapped Lindbergh Baby" by Larry Kusche, but my library had no copy of it. I can't find it online. Is this book still available somewhere? If so, where? Feeding behaviour and dairy cow comfort. The article is devoted to the effect of certain dairy cow feed management strategies on the comfort of dairy cows. The most frequent symptoms of ill health in dairy cows are colic, disorders of reproduction, mastitis, lameness, pneumonia and poor performance. The studies were carried out to assess the role of feeding strategy and feeding frequency in the development of the above diseases. The studies were carried out in two experimental halls in the dairy industry on an experimental farm in western Poland. All the cows were of the Polish Holstein breed. Over a period of 4 years, 2,620 lactations (mean duration of 305 days) were investigated. The trials were carried out on six farms, with a mean of 7.6 lactations per farm. The first study focused on the incidence of respiratory disorders in the affected and non-affected cows with regard to feeding strategy. In the second study, reproductive disorders were investigated, as well as the incidence of the above disorders in the group of affected and non-affected cows with regard to feeding strategy. The third study focused on colic in the group of affected and non-affected cows with regard to feeding strategy. The final study focused on the effect of feeding strategy and feeding frequency on the occurrence of mastitis in dairy cows. The obtained results indicate that the following strategies are conducive to the development of respiratory, reproductive and digestive disorders in cows: the reduced use of concentrate in the diets of cows in dairy production and the use of feed additives, which are supposed to positively influence the health status of dairy cows. These are: organic acids, which improve digestion, bacteria that facilitate the growth of beneficial bacteria, probiotics and prebiotics, which improve the intestinal microflora. In the same trials the feeding strategy did not affect the occurrence of colic, colitis and metritis in the group of affected and non-affected cows. It was observed that the frequency of feeding is not related to the occurrence of colic and respiratory disorders. Cows in the feed restriction group had fewer days in which they were dry. This did not affect reproductive function. The results suggest that the frequency of feeding and the feeding strategy of dairy cows are important factors in the development of disorders of the digestive system.
